

Summary

The invention relates to a connecting element for the releasable connection of a
5 first part with a second part, in particular a bowden cable with a lever, wherein the
connecting element comprises a housing which is rigidly mounted to the first part,
an engaging element mounted to the second part and a slide having a receiving
element complementary shaped to the engaging element for the releasable con-
10 nection of the engaging element with the receiving element. The slide can inside
the housing slide from a first position into a second position for latching the re-
leasable connection between the engaging element and the receiving element. The
connecting element further comprises at least one latching means for fixing the
slide in the second position and at least one releasing means for manually acting
15 onto the at least one latching means in order to release the slide from the second
position for the unlatching of the releasable connection between the engaging
element and the receiving element.
